6.1.4	Configure QVD for your network	10
6.2	Configure QVD to use the SSL certificates	10
6.3	Configure HKD Node	10
7	And now, what?	11

Warnings

**Important**

The current guide contains the necessary commands to make a **mononode** QVD installation, where all the components will be installed into the same machine. In a multinode installation, there will be additional steps and network configuration may be different.

**Important**

During the process, some packages will be installed and the network configuration will be affected. It is recommended to use a testing environment.

**Important**

For practical purposes, the hostname will be identified with the name **qvdhost**, in your case you must replace it with the name corresponding to your server.

Chapter 1

Requirements

1.1 Operating System

To download CentOS 7.9 you can go directly to the website www.centos.org to its section [downloads](#) or choose it from the list [mirrors](#). It is recommended to use the **minimal** version.

1.2 Hardware

- 2 CPU cores
- 2 GB of RAM
- Hard drive at least 20GB

1.3 Database

- PostgreSQL 10 or higher

1.4 HKD

- [x86_64](#) architecture.

Chapter 2

Pre-installation

```
rpm --import https://www.theqvd.com/packages/key/public.key
yum install -y yum-utils
yum-config-manager --add-repo http://theqvd.com/packages/centos/7.9/QVD-4.2.0/
yum update
```

For commercial packages:

```
rpm --import https://www.theqvd.com/packages/key/public.key
echo "[QVD-4.2.0]" > /etc/yum.repos.d/QVD-4.2.0.repo
echo "name=QVD-4.2.0" >> /etc/yum.repos.d/QVD-4.2.0.repo
echo "baseurl=http://$USUARIO:$PASSWORD@theqvd.com/commercial-packages/centos/7.9/QVD ←
-4.2.0/" | \
    sed 's/@\(..*@\)/%40\1/' >> /etc/yum.repos.d/QVD-4.2.0.repo
echo "enabled=1" >> /etc/yum.repos.d/QVD-4.2.0.repo
yum update
```

Note

`$USER` and `$PASSWORD` are the credentials received when the suscription is purchased.

Install the necessary tools

```
yum install -y bridge-utils
```

Chapter 3

Database installation and configuration

```
yum install -y https://download.postgresql.org/pub/repos/yum/reposrums/EL-7-x86_64/pgdg- ↵  
redhat-repo-latest.noarch.rpm  
yum install -y postgresql10-server postgresql10-contrib  
/usr/pgsql-10/bin/postgresql-10-setup initdb  
systemctl start postgresql-10.service
```

3.1 Create a user account

```
su - postgres  
postgres@qvdhost:~$ createuser -SDRP qvd  
Enter password for new role: passw0rd  
Enter it again: passw0rd
```

3.2 Create the QVD database

```
postgres@qvdhost:~$ createdb -O qvd qvddb  
postgres@qvdhost:~$ exit
```

3.3 Change the PostgreSQL configuration

Edit the file `/var/lib/pgsql/10/data/pg_hba.conf` and add the following line **to the beginning**:

```
host qvddb qvd 127.0.0.0/24 md5
```

**Note**

Make sure to replace the default network 127.0.0.0/24 with the network that your platform uses.

Edit the file `/var/lib/pgsql/10/data/postgresql.conf` and set the following parameters:

```
listen_addresses = '*'  
default_transaction_isolation = 'serializable'
```

Restart PostgreSQL.

```
systemctl restart postgresql-10.service
```

Chapter 4

Installation of the HKD

```
yum install -y perl-QVD-HKD
```

4.1 Basic configuration

Copy the example configuration file to the `/etc/qvd/` directory, save it as `node.conf`, and modify the permissions on it:

```
cp -v /usr/lib/qvd/config/sample-node.conf /etc/qvd/node.conf
chown root:root /etc/qvd/node.conf
chmod 0640 /etc/qvd/node.conf
```

Edit the file `/etc/qvd/node.conf` and modify/add the following entries:

```
nodename=qvdhost
database.host=localhost
database.name=qvddb
database.user=qvd
database.password=passw0rd
```

Enable HKD service:

```
systemctl enabled --now qvd-hkd
```

4.2 QVD tables population

```
/usr/lib/qvd/bin/qvd-deploy-db.pl
```

Chapter 5

Administration tools installation

5.1 SSL Configuration

**Note**

If you already have a certificate signed by a third party, you can skip the auto signed certificate creation and use your signed certificate instead.

Auto signed certificate creation

```
yum install -y openssl
mkdir /etc/qvd/certs
cd /etc/qvd/certs
```

Generate a private key.

```
openssl genrsa 2048 > key.pem
```

Create an auto signed certificate.

```
openssl req -new -x509 -nodes -sha256 -days 3650 -key key.pem > cert.pem
```

**Note**

OpenSSL will prompt you to enter the various fields that it requires for the certificate. In the field **Common Name** you must insert the fully qualified domain name of the host that will be running your QVD node.

5.2 API

```
yum install -y perl-QVD-API
```

Create the file `/etc/qvd/api.conf` with the following content:

```
database.host=localhost
database.name=qvddb
database.user=qvd
database.password=passw0rd
api.user=root
api.group=root
path.api.ssl=/etc/qvd/certs
```

To execute either the CLI or the WAT we must enable the API.

```
systemctl enable --now qvd-api
```

Calling to the endpoint *info* from the browser or using the following command, we will check that the API is working.

```
# curl -k https://localhost:443/api/info
```

It should return a JSON with system information.

5.3 CLI

```
yum install -y perl-QVD-Admin4
```

Create the file `/etc/qvd/qa.conf` with the following content:

```
qa.url = https://localhost:443/
qa.tenant = *
qa.login = superadmin
qa.password = superadmin
qa.format = TABLE
qa.insecure = 1
```

Caution

This is just a testing installation guide. Never for be using in production environment. The parameter `qa.insecure` must be replaced by the parameter `qa.ca` with your Authority certification path.

With the following command we will check that QA4 is working.

```
# qa4 admin get
```

It should return the two administrators of the system: admin and superadmin.

```
.----+-----+-----+-----+
| id | name      | language | block |
+----+-----+-----+-----+
|  1 | superadmin | auto     |   10 |
|  2 | admin      | auto     |   10 |
'----+-----+-----+-----+'
Total: 2
```

5.4 WAT

```
yum install -y qvd-wat
```

Executing the WAT

Visit <https://localhost:443>

Credentials:

- **username:** superadmin@*
- **password:** superadmin

Chapter 6

Basic and indispensable configuration

6.1 Network configuration

6.1.1 Set dnsmasq to be controlled by QVD

```
rpm -q dnsmasq
```

If it is not installed:

```
yum install -y dnsmasq  
[ `systemctl is-enabled dnsmasq.service` == "enabled" ] && systemctl disable dnsmasq. ↵  
service || echo "success disabled"
```

6.1.2 Configure IP forwarding

Edit the file `/etc/sysctl.conf` and uncomment the line:

```
net.ipv4.ip_forward=1
```

Execute:

```
sysctl -p
```

6.1.3 Configure a network bridge

Check if the bridge module is loaded with the command:

```
modinfo bridge
```

If it is not loaded, execute:

```
modprobe --first-time bridge
```

Create the network bridge

```
nmcli connection add ifname qvdnet0 connection.type bridge ipv4.addresses 10.3.15.1/24 ipv4 ↵  
.method manual
```

Bring up the network interface:

```
nmcli conn qvdnet0 up
```

Restart the network:

```
systemctl restart network
```

6.1.4 Configure QVD for your network

```
# qa4 config set tenant_id=-1,key=vm.network.ip.start,value=10.3.15.50
# qa4 config set tenant_id=-1,key=vm.network.netmask,value=24
# qa4 config set tenant_id=-1,key=vm.network.gateway,value=10.3.15.1
# qa4 config set tenant_id=-1,key=vm.network.dns_server,value=10.3.15.254
# qa4 config set tenant_id=-1,key=vm.network.bridge,value=qvdnet0
```

6.2 Configure QVD to use the SSL certificates

```
qa4 config ssl key=/etc/qvd/certs/key.pem, cert=/etc/qvd/certs/cert.pem
openssl version -d
```

The previous command may return the following response by default:

```
OPENSSLDIR: "/etc/pki/tls"
```

Note

If other directory is returned, use it instead `/etc/pki/tls` for the following steps.

The trusted certificates are stored in `/etc/pki/tls/certs`.

```
trusted_ssl_path=/etc/pki/tls/certs
cert_path=/etc/qvd/certs/cert.pem
cert_name=`openssl x509 -noout -hash -in $cert_path`.0
cp $cert_path $trusted_ssl_path/QVD-L7R-cert.pem
ln -s $trusted_ssl_path/QVD-L7R-cert.pem $trusted_ssl_path/$cert_name
```

6.3 Configure HKD Node

Add the node to the solution by running:

```
qa4 host new name=qvdhost,address=10.3.15.1
```

Chapter 7

And now, what?

Should you have any issue, please check the full QVD installation guide.

If you have already done all the steps of this guide, congratulations, you already have a solution QVD installed. Now you should:

- Configure your first OSF
- Install your first image
- Add your first user
- Add a VM for your user

We recommend to you to continue with **the WAT guide** to do these steps.

Once finished, you will only have to connect and try the solution.

Check **the quick guide to install the QVD client** in your system.

If you have any question or need additional support, visit our website at <http://theqvd.com/> or contact with us at info@theqvd.com.
